

Locations of Articulate player templates and other objects -

In order to find many of the folders below, Windows Explorer must be set to view hidden files and folders. This can be done by carrying out the following steps:

Open up the Control Panel from the Start menu, and select “Folder Options”. In the “View” tab, ensure that the option to “show hidden files and folders” is selected. This process is the same in Vista, XP and Windows 7.

Below are the filepaths for the locations of templates, logos, presenters and colour schemes for all Articulate programs, for Windows XP, Windows Vista and Windows 7 operating systems. Any new ones created on one machine can be copied and pasted into the correct locations on others, allowing Articulate to pick up these objects and use in other projects.

<p>Once a project with objects “in project” has been published on another machine, template can be found in here (the file will be called playerproperties.xml). The folders within “Project” folder relate to each project published on your machine which was created elsewhere. These sub-folders have meaningless names, so to identify which is the right one look at the date modified.</p>
